I, ASIR IYADURAI JEBARAJ, HAVING MY RESIDENCE AT 4<sup>TH</sup> MAIN ROAD, HINDU COLONY, PUZUTHIVAKKAM, CHENNAI - 600 091, STATE OF TAMIL NADU, INDIA.

**THE FOLLOWING SPECIFICATION PARTICULARLY DESCRIBES AND ASCERTAINS THE NATURE OF THIS INVENTION AND THE MANNER IN WHICH IT IS TO BE PERFORMED :**

## **SELFCONTAINED AIR CONDITIONED ENCLOSURE**

### **BACKGROUND-FIELD OF INVENTION**

This Invention relates to as comfort Air Conditioning, specifically to an air condition apparatus to provide an air-conditioned Enclosure for indoor or outdoor use that is compact and portable.

### **BACKGROUND-DESCRIPTION OF PRIOR ART**

Air-conditioning of space with units employing refrigerants are used for cooling space for personal comfort. Commercial air conditioners employing refrigerants have the following disadvantages:

- (a) ***Higher Capital investment in the space to be air-conditioned :*** For effective and efficient use of Air Conditioning requires a room or a building to be built with thermal insulation, air infiltration seals, shaded windows and other special requirements. Such special requirements result in higher capital investment in addition to the cost of the air conditioner.
- (b) ***Higher Capital Investment for larger air-condition unit :*** The minimum space that could be effectively air-conditioned using the traditional air condition unit is an entire room, even if conditioning is required only for a portion of the room that is occupied. Commercial portable air conditioners have the same limitation. The larger the space to be air-conditioned the larger is the air condition

unit required. Larger the unit higher the cost. For example In a bedroom the minimum space that requires air-conditioning is the compact space surrounding the body of the occupants. In current application the entire bedroom needs to be air-conditioned. This will result in unnecessary extra cost of larger equipment and installation.

(c) *Higher Operation cost* : As discussed in previous paragraphs traditional units would be of larger capacity than the minimum needed for specific application. Larger the unit higher is the operating cost for electric energy. Cooling of a selective smaller space offers comfort at a lower operational cost. A selected Enclosure could be cooled with commercially available portable air conditioner however the disadvantage is the portable air conditioner can not supply cooled fresh air but only re-circulates the space air.

(d) Enclosures available for clean air requirements such as Michael H. Pelosi, III et al U.S. Pat. No. 5314377 is not suitable for comfort Air Conditioning of a compact space, as it requires an independent source of conditioned air in the place of the clean air source. Also the prior art Enclosure has cumbersome structure requiring complex assembly. The objective of this Enclosure is to provide clean air and not comfort conditioning, so major modification is necessary before it can be used for comfort air condition application.

Commercially available portable air conditioner can cool an enclosed space however the disadvantage is it cannot supply cooled fresh air but can only re-

circulates the space air. Thus none of the current apparatuses are suitable for providing an air-conditioned enclosure.

Air Conditioned Mosquito net of patents such as San Jianhua et al China. Pat. No. CN2259099 and Tan Mingsen et al China. Pat. No. CN1163735, illustrates mosquito nets connected to a conditioned air source by an air duct. Both of these prior art requires an external source of conditioned air. Also in both of these prior arts, outside air is conditioned and supplied to the enclosure and all of the air is exhausted outside the enclosure. 'Heat Insulating Mosquito-Net' of He Baoan et al China. Pat. No. CN1061140, illustrates a mosquito-net with plurality of inflatable air-pocket walls. This air has the disadvantage of requiring inflation and increases the chance of failure of thermal insulation due to puncturing of the inflated air pockets.

### **SUMMARY**

In accordance with the principles of the present invention there is an air-conditioned Enclosure assembly comprising of a portable Air Conditioning Unit and a connected Enclosure to provide an air-conditioned enclosed space with fresh air supply, that is self contained, portable and modular.

### **OBJECTS AND ADVANTAGES**

Accordingly, besides the objects and advantages of original air condition apparatus, several objects and advantages of the present invention are:

- (a) to provide a portable space Enclosure assembly for personal comfort, through desired temperature, humidity and filtered fresh air;
- (b) to provide personal comfort at economical initial cost, as the air condition unit can be smaller in capacity to condition a small occupied space;
- (c) to provide personal comfort at economical operating cost, as conditioning of only the occupied space requires less electric energy;
- (d) to provide energy conservation through re-circulating a part of the enclosure air;
- (e) to provide cooled or heated fresh air to offer better air quality for the occupants;
- (f) to provide energy conservation by pre-cooling the fresh inlet air with the cool exhaust air. The same applies for heating too;
- (g) to provide control over the quantity of fresh air using air damper;
- (h) to improve the efficiency of the system by using the exhaust air for the condenser coil cooling;
- (i) to provide an air-conditioned personal space for both indoor and outdoors use;
- (j) to provide reduced initial cooling time from the start of cooling to achieve the comfort temperature. The same applies for heating too;

- (k) to provide comfort air-conditioning without requiring special building construction requirements such as thermal insulation, air infiltration seals, shaded windows and others;
- (l) to provide an Enclosure for quick assembly using widely available materials;
- (m) to provide a dedicated Air Conditioning Unit to provide comfort to the enclosed space

The process of air condition referred in this invention generally refers to heating or cooling, humidification or dehumidification, and filtering of air for comfort. Further objects and advantages are to provide economical personal comfort through reduced initial cost, reduced operating cost, portability, and targeted space cooling for a specified time. Still further objects and advantages will become apparent from a consideration of the ensuing description and drawings.

**DESCRIPTION OF THE INVENTION - PREFERRED EMBODIMENT**

A preferred embodiment of the Air Conditioned Enclosure of the present Invention is illustrated in FIG 1. The Air Conditioned Enclosure comprises of an Enclosure 1, which is structurally supported by a skeleton or Frame 2, and connected through plurality of openings to air ducts of an Air Conditioning Unit 17. The enclosure is shown in the Fig as assembled over a bed with mattress 12.

FIG 2 shows the said Frame 2, is assembled with beams, pylons or Frame Members 3, preferably made of tubes of suitable size and material. The Frame Members 3, form a rectangular configuration and have plurality of vertical extensions or legs. In the preferred embodiment the Frame Members are telescoping plastic tubes assembled with Corner Connectors 4. The Corner Connector 4, support and connect three of the Frame members 3, to structurally form the corner of the said Frame 2. The Corner Connector 4, is a three-dimensional socket to receive three of the said Frame Members 3, two of the said Frame Members that are perpendicular to each other and forms two sides of the said rectangular configuration and another Frame member that forms a leg, vertical to the said rectangular configuration. The Enclosure has a cornice, top or Roof 5, preferably constructed of suitable translucent lightweight rigid board with insulation properties. One sidewall of the said Enclosure has Openings 13 and 14 to accommodate Air Ducts of the Air Conditioning Unit. The above said openings have elastic Rims 15 and 16.

**FIG 3A** illustrates the section view of the enclosure sidewall assembly and its support facilities and jointing arrangements made available in the Invention. The Roof 5, has a vertical rim or Lip 6 around it and plurality of attached Support Straps 7 of suitable size, strength and material. The said Support Straps are used to suspend the said Roof from the said Frame. The said Support Straps wraps around the said Frame Members 3 forms a loop and fastens on to itself, preferably using hook-and-loop fastener. The sidewalls of the Enclosure are made of plurality of Enclosure Wall Sheets 8, made of suitable material that is transparent, flexible, lightweight and having good thermal properties, preferably plastic sheet.

**FIG 3B** shows an exploded partial section view of the Roof and enclosure sidewall assembly of **FIG 3A**. There is plurality of thin Spacer Strips 9, of suitable thickness, flexible, lightweight, and preferably translucent strips of foam sheet or sponge. The Spacer Strips 9, are located between the above said Sheets 8, at sufficient intervals. This arrangement forms air space or pockets between the Sheets, to enhance the thermal resistance of the Enclosure wall assembly.

**FIG 3B** also shows the method of fastening the enclosure sidewall to the said Roof 5. The said Sheets 8, and Spacers 9, are overlaid to cover the top portion of the Roof Lip 6. The said Sheets and the said Spacer are covered by plurality of covers or Shield 10, and held by plurality of clevis or Clip 11. The Shield's function is to cover the said Sheets 8, and Spacers 9, and protect against damage from the Clip 11. In the preferred embodiment there are four Shields, one on each side of the enclosure Roof 5. The Clip 11 is made of suitable material preferably metal.

The lower portion of the Enclosure wall assembly comprised of Sheets 8, and Spacer Strips 9, is tucked or inserted under the structure that forms the floor; for example in when the Enclosure is used over a bed, the floor is formed by the mattress 12 and the Enclosure walls are tucked under the mattress to form a good air tight Enclosure as shown in Figs. 1, 2 and 3A.

**FIG 4** Illustrates the perspective view of the Air Conditioning Unit 17. The said Air Conditioning Unit 17, has traditional air conditioner parts such as compressor, evaporator coil, condenser coil, air filter, fan, blower, motors and controls. The said unit 17, has a housing or a body 18, of suitable material preferably plastic exterior or walls, and structurally supported by steel frames. Attached to the bottom of the housing is plurality of wheels or castors 19 for mobility of the Unit.

The air conditioner unit includes a Control Panel 41, located on the front side of Unit. The control panel consists of a Temperature Control 34, a Temperature Gauge 35, and a Fresh Air Control Knob 36. At the bottom of the Unit 17, plurality of Air Grill 33 is located. The portion of the Air Grills on the walls of the Compressor Chamber 31, supplies outside air to the Compressor Chamber. While the portion of the Air Grills on the walls of the Fresh Air Chamber 16, supplies outside air to the Enclosure.

**FIG 5 and 6** shows cross section views of the Air Conditioner Unit 17. There is an Exit Air Duct 20, connected preferably to the top of the housing 18. There is a Supply Air Duct 21, on one side of the said housing 18. The above said Exit Air Duct

20, made of suitable material to be flexible, collapsible and both the said ducts preferably constructed with thermal insulation. The said ducts 20 and 21, have plurality of lips at the extremity to form a narrow channel 22, within which the respective elastic rims of the Enclosure 15 or 16, shown in Fig. 2, sits and forms an airtight connection between the said Enclosure 1 and the Air Conditioning Unit 17.

The Exit Air Duct 20, connects to an Air Plenum 23. At the lower part of the Air Plenum an Air Filter 25 is located. An air moving device such as a Fan Motor assembly 24, consisting of a fan, a motor and structural support is located below the said Air Filter. Below the Fan Motor Assembly is located the Evaporator Coil Assembly 26. In the preferred embodiment Evaporator Coil Assembly consists of a refrigerant evaporator coil bank and may include an electric heating element. Below the said evaporator coil assembly is the Supply Air Duct 21.

Next and below the Supply Air Duct 21, is located a fan or blower assembly 27. Note that fans and blowers generally refer to any air-moving device and can be used interchangeably in this preferred embodiment. The said blower assembly consists of the blower, motor, air intake hood, housing and other essential elements. The blower has an Exhaust Air Duct 28 attached to its side and extends through the backside of the unit's housing 18. The exhaust Air Duct 28, is preferably flexible, collapsible, lightweight and round duct structure. The blower assembly has an air Intake hood 29, it is rectangular prism shaped with the smaller end transitioning to a circular shape and attached to the blower. The lower end of the intake air hood 29, is sized to cover the top of the condensing coil bank 30.

Next and below the blower is a Condensing Coil Bank 30, for condensing the refrigerant vapor. Below the Condensing Coil Bank is a space, volume or Compressor Chamber 31. The lower portion of the Compressor Chamber, which is also the lower portion of the housing have plurality of Air Grills 33. Contained within the compressor chamber is a refrigerant compressor assembly 32. The compressor assembly includes a hermetic refrigerant compressor, motor and necessary electrical and control elements. The chamber may also house required electric circuit, control system circuit, voltage stabilizer and other auxiliaries. The said compressor is connected to the evaporator coil assembly 26, and the condenser coil bank 30, with metal tubes of suitable material and size.

Inside the housing is a space or Fresh Air Chamber 36, a rectangular prism shaped volume located on one side of the unit that extends up to the Air Plenum 23 at the top and to the bottom of the Unit 17. The Fresh Air Chamber 36 also has the said Air Grills 33, at the bottom. The said Fresh Air Chamber 36 is thermally insulated and does not have air communication with the Compressor Chamber 31.

Inside the Fresh Air Chamber 36, is a Heat Transfer Duct 37, which is preferably flexible, collapsible, lightweight and round or rectangular duct structure with good heat transfer property. At the same level or height of the control Panel, there is an Air Damper 39 in the Heat Transfer Duct 37 connected to the Control Knob 38 with Control Rods 40 and links. The said Air Damper 39 is a butterfly valve type damper to control airflow inside the Heat Transfer Duct 37. The Heat Transfer Duct is

connected at the top with the Air Plenum 23, and at the bottom end It Is connected to the Compressor Chamber forming an air passage between the Air Plenum and the Compressor Chamber. Finally there Is an electric cord wth connector to connect with an electrical power source or a wall outlet.

### ***Advantages***

According to the Invention, there is provided an Air Conditioned Enclosure assembly comprising of

- a portable Air Conditioning means and
- a connected Enclosure to provide an air conditioned enclosed space, with fresh air supply

said Enclosure comprising :-

- a. an Enclosure suitable to be fitted on to any flat surface.
- b. Frame - means to support the Enclosure structure and assembled with frame members.
- c. Roof - means of light board structure with vertical rim or lip along the periphery.
- d. Support straps means on the roof to suspend the said roof onto said frame.
- e. Sidewalls - means plurality of plastic sheets along with spacer strips.
- f. Roof lip, shield and clip means - to hold the sidewalls onto the said Roof.
- g. Openings In Enclosure means to accommodate air ducts of air-conditioning unit.

h. Air conditioner means - for cooling the Enclosure.

and said Air Conditioning means comprising of :-

- (i) a main housing.
- (ii) an exit air duct connected on the top of the said housing.
- (iii) an Air Plenum connected to the said exit air duct.
- (iv) an air filter is located at the bottom of the said Air Plenum.
- (v) a fan motor assembly is located at the bottom portion of the said Air Plenum next to the said Air Filter.
- (vi) an evaporator coil assembly is fixed below the said air filter.
- (vii) a supply air duct is connected on one side of the said housing and below the said evaporator coil assembly.
- (viii) a fan blower assembly connected below the said supply air duct.
- (ix) an exhaust air duct is attached to the said fan-blower assembly on its side and extends through the back side of the said housing.
- (x) a condensing coil bank is fixed below the said blower.
- (xi) a compressor chamber is fixed below the said condensing coil bank.
- (xii) a control panel located on the side of said supply air duct.
- (xiii) Fresh Air Chamber Inside the housing extending from the bottom to the Air Plenum at the top and has air grills at the bottom.

The Enclosure may have one of several shapes such as rectangle, square, cylindrical or a combination thereof.

Various types of air condition may be generally referred to but the invention is particularly adapted to a process of heating or cooling, humidification or de-humidification and filtering of air only.

The invention comprising of an Enclosure and an air condition unit can be fitted on to any flat surface. In the embodiment described, the frame of the Enclosure is structurally fitted onto the floor surface and the wall sheets tucked at the floor level under the structure that forms the floor. This forms a good airtight Enclosure, which is thermally isolated.

The one sidewall of the Enclosure has 2 openings with elastic rims to accommodate air ducts i.e. exit air duct and supply air duct of the Air Conditioning Unit.

The Air Conditioning Unit has the traditional parts such as compressor, evaporator coil, condenser coil, air filter, fans, motor, controls and others assembled as described in the preferred embodiment to supply fresh air and re-circulated cool air to the said Enclosure of the preferred embodiment.

The present invention provides a portable airtight Enclosure system with openings for receiving the Air Conditioning ducts and an Air Conditioning Unit for providing a suitable clean, cool and conditioned atmosphere, within the said Enclosure system. The Enclosure system can assume various shapes suitably in accordance with the shape of the frame, which is the structural support for the said Enclosure. In

the preferred embodiment of the present invention, there is provided a rectangular system comprising a hard board roof with soft sheet walls thus ensuring insulation on all sides.

In accordance with the present invention there is provided a method for providing a suitably conditioned Enclosure which comprises of using an air conditioner means which comprises the steps of enclosing a volume of air in the Enclosure filtering and conditioning fresh air and supplying the conditioned air to the said Enclosure, and exhausting the air from the Enclosure.

Advantages of this system are that it provides for a simple, portable, economical, Enclosure system, which is easy to manufacture and sell and equally easy to assemble and to dismantle when not in use. The Air Conditioning Unit also provides for energy conservation by pre-cooling / pre-heating the fresh inlet air with the cool/hot exhaust air. Also the condenser coil cooling is enhanced by using the exhaust air. The present invention as a whole is in-expensive, more compact, more efficient and portable.

Another example of the Enclosure structure similar to the one described herein above, is to have the following :-

As an extension of scope of invention, a typical eg. is to have a single pre-fabricated foldable Enclosure - comprising of frame work including the roof, the side

wall sheets and spacer strips. This is simple to avoid the assembly work involved in the preferred embodiment herein above described in the previous paragraphs.

The Enclosure is prefabricated with the wall sheets and spacer strips including a roof portion and drapes over the frame structure. One side of the wall may be provided with re-sealable opening for people passage preferably with hook and loop fasteners.

#### **WORKING OF THE INVENTION**

The working of the invention is herein described in detail. The said Enclosure assembly 1, creates an isolated air space above an occupied surface, an example of such an application is around a bed as shown in FIG 1.

The Enclosure isolates the inside space from the outside thermally and avoids outside air infiltration. The said air opening rims 15 and 16, wrap around the said Air Ducts, and offers air passage or connection with the Air Condition Unit 17. The Enclosure assembly is structured to be lightweight, to cost less, and to offer quick and easy assembly and disassembly; thus offering portability.

Enclosure air is drawn through the Exit Air opening 13 and Exit Air Duct 20. Part of the air from duct 20 and Fresh air from Fresh Air Chamber 36 is mixed in the Air Plenum 23. The air is filtered through the Air Filter 25 and is moved by fan 24

through the Evaporator Coil Assembly 26, where it is conditioned. The conditioned air enters the Enclosure through the Supply Air Duct 21.

Part of the Exit air from duct 20 passes through the Heat Transfer Duct 37 to Compressor Chamber 31. The Air Damper 39 controls the flow of air inside the Heat Transfer Duct 37. Air Damper 39 is adjusted by the Control Knob 38 interconnected by Control Rods 40 and links. The air in duct 37, pre-conditions, pre-cools or pre-heats the fresh air in the Fresh Air Chamber 36. This pre-conditioning of the fresh air by the exhaust air conserves energy. The Fresh Air chamber is supplied by fresh air through the Air Grills 33 located at the bottom.

Outside air is also drawn inside the compressor chamber 31, through the air grills at the lower portion of the said Chamber. Air from the Heat Transfer Duct 37, enters the said chamber 31, and mixes with air in the chamber, and is moved by the blower 27. The blower moves the air mixture across the condenser coil assembly 30, and exhausts it through the exhaust duct 28. The exhaust duct's free end may be located to exhaust hot air outside of the building through a window or doorway if the invention is used indoor. For outdoor use the exhaust duct can exhaust to the space.

#### ***Conclusions Ramifications and Scope***

The above description illustrates the Self-contained Air Conditioned Enclosure provides air-conditioned comfort with fresh air at economical capital cost, conserves

energy, operates with lower cost, is portable can be assembled easily and has longer life.

While the above contains many specifications these should not be construed as limitations on the scope of the invention, but rather as an exemplification of one preferred embodiment thereof. Many other variations are possible a few examples follow.

The rigid Enclosure Roof of the enclosure can replaced with an assembly similar to the sidewalls, with Wall Sheets and Spacer Strips. The enclosure Frame structure instead of located outside the enclosure could be placed inside and support the enclosure. The enclosure can be colored and have other shapes such as circular, square or combination thereof. The Enclosure sidewall can have slit opening for entry or exit to the enclosure that can be sealed and fastened by hook-and-loop fasteners etc.

The components of the Air Condition Unit can be rearranged to serve the same purpose as this invention. The Air moving devices can be connected with a longer shaft driven by a single electric motor. The air conditioner or its control can be modified to work as a heat pump. The Unit size can be compacted by eliminating the Fresh Air Chamber and Heat transfer duct at the expense of energy conservation.

Thus the scope of the invention should be determined by the appended claims and their legal equivalents, rather than by the examples given.

We Claim :-

1. An air conditioned Enclosure assembly comprising of a portable Air Conditioning means and a connected Enclosure to provide an air conditioned enclosed space, with fresh air supply, said Enclosure comprising of :-

- a. an Enclosure suitable to be fitted on to any flat surface,
- b. Frame - means to support the Enclosure structure and assembled with frame members, corner connectors,
- c. Roof - means of lightweight board structure with vertical rim or lip along the periphery,
- d. Support straps means on the roof to suspend the said roof onto said frame,
- e. Sidewalls - means plurality of plastic sheets along with spacer strips,
- f. Roof lip, shield and clip means - to hold the sidewalls onto the said Roof,
- g. Openings in Enclosure means to accommodate air ducts of air-conditioning unit,
- h. Air conditioner means - for cooling the Enclosure,

and said air conditioner means comprising of:-

- i) a main housing,
- ii) an exit air duct connected on the top of the said housing,
- iii) an Air Plenum connected to the said exit air duct,
- iv) an air filter located at the bottom of the said Air Plenum,
- v) An air moving devise such as a fan motor assembly located at the bottom portion of the said Air Plenum next to the said air filter,
- vi) an evaporator coil, heater element assembly fixed below the said air moving devise,
- vii) A supply air duct connected on one side of the said housing and below the said evaporator coil assembly,

- viii) A second air moving devise such as a fan blower assembly fixed below the said supply air duct,
- ix) An exhaust air duct attached to the said fan blower assembly on its side and extends through the back side of the said housing,
- x) A Condensing Coil Bank fixed below the said blower,
- xi) A compressor chamber containing a compressor fixed below the said condensing coil bank,
- xii) A control panel located on the side of said supply air duct,
- xiii) A Fresh Air Chamber located inside the housing, extending from the said Air Plenum at the top, to the bottom of said Air Conditioner Housing,
- xiv) A Heat Transfer Duct located inside the said Fresh Air Chamber connected to the said Air Plenum at the top and connected to the said Compressor Chamber at the other end,

2. The Enclosure system of claim 1 (a), wherein the Enclosure thermally isolates the enclosed space from the surroundings,

3. The Enclosure system of claim 1 (b), wherein the Frame means includes frame members and corner connectors to form a rectangular configuration and have plurality of vertical extensions or legs,

4. The Enclosure system according to claim 3, wherein the said frame members are made of telescoping tubes of suitable size, preferably plastic tubes, assembled with said corner connectors to create the said Enclosure of adjustable size,

5. The Enclosure system of claim 1 (c), wherein the Enclosure has a roof construction suitably of lightweight rigid board structure with insulation properties,

6. The Enclosure system of claim 1 (d) and claim 6, wherein the said roof has a vertical rim or lip, around it and plurality of support straps, such that when the said roof is suspended from the said frame, the said support straps wraps around the said frame members and forms a loop and fastens on to itself, preferably using hook and loop fasteners,
7. The Enclosure system of claim 1 (e), wherein the sidewalls are made of plurality of Enclosure wall sheets and are preferably transparent plastic sheets,
8. The Enclosure system of claim 1 (e), wherein air space is formed between the wall sheets , by fixing plurality of thin, flexible, lightweight spacer strips of suitable thickness, preferably strips of foam sheets or sponge at sufficient intervals to enhance thermal resistance of said Sidewalls,
9. The Enclosure system of claim 1 (f), wherein the said wall sheets and said spacers are overlaid to cover the top portion of the said roof lip and held at the top by means of plurality of shields and plurality of clips, the said shields hold and protect the said wall sheets and said spacer strips against structural damage from the said clip,
10. The Enclosure system of claim 14, wherein the lower portion of the Enclosure wall assembly comprising of wall sheets and spacers strips are tucked under the structure that forms the floor to close the enclosure bottom from the surrounding,

11. The Enclosure system of claim 1 (g), wherein one side wall of the Enclosure has opening to accommodate the air ducts of the air conditioner unit i.e. said exit air duct and said supply air duct. The said openings have elastic rims to ensure proper and tight sealing at the openings,
12. The air conditioner means as claimed in claim 1 (h) and sub-para (ii) and (vii) wherein the said ducts i.e. said exit duct and said supply air duct have plurality of lips at the extremity to form a narrow channel, within which the said respective elastic rims of the said Enclosure, sits and forms an air tight between the said Enclosure and the said Air Conditioning means,
13. The air conditioner means as claimed in claim 1 (h) and sub-para (v) and (viii), wherein the said air moving devises such as a fan assembly or blower assembly consists of fan or blower, motor, air intake hood, housing and other essential element,
14. The air conditioner means as claimed in claim 1 (h) and sub-para (vi), wherein the said evaporator coil assembly consists of a refrigerant evaporator coil bank and also electric heating element for conditioning the air passing through the said assembly,
15. . The air conditioner means as claimed in claim 1 (h) and sub-para (ix), wherein the said blower as claimed in claim 21 has an exhaust air duct attached to its side and extends through the back of the housing that is preferably flexible, collapsible, light weight round air duct,

16. The air conditioner means as claimed in claim 1 (h) an sub-para (xi), wherein the lower portion of the said compressor chamber which is also the lower portion of the housing have plurality of air holes to form an air grill in the housing wall,

17. The air conditioner means as claimed in claim 1 (h) and sub-para (xii), wherein the said control panel consists of control knobs for temperature, fresh air volume, humidity, light and temperature gauge, light bulb, clock with alarm and other necessary gadgets,

18. The air conditioner means as claimed in claim 1 (h) and sub-para (xiii), wherein the said Fresh Air Chamber consists of :-

- a Heat Transfer Duct inside the said Fresh Air Chamber, along with,
- an air damper in the said Heat Transfer Duct at the same level of the said control panel and
- a control knob connected to Heat Transfer Duct with rods and links control the amount of exit air that is replaced by fresh air in the Enclosure,

19. The said Fresh Air Chamber as claimed in claim 28, wherein the Heat Transfer Duct is connected at the top with the said Air Plenum and at the bottom it is connected to the said compressor chamber forming an air passage between the said Air Plenum and the said compressor chamber to exhaust part of the said exit air to the said compressor chamber;

20. The said Fresh Air Chamber as claimed in claim 28, wherein the Fresh Air Chamber has a Heat Transfer Duct, made of preferably flexible, collapsible, and lightweight duct structure with good heat transfer property,
21. The said Fresh Air Chamber as claimed in claim 28, wherein the said Fresh Air Chamber does not have any direct air communication with the said compressor chamber and supplies fresh air to the said Air Plenum,
22. The Fresh Air Chamber and the Heat Transfer Duct assembly conserves energy by transferring energy from the said Exit Air in the said Heat Transfer Duct to the fresh air in the Fresh Air Chamber, and also by supplying the said Exit Air to the said Condensing Coil Bank,
23. An air-conditioned Enclosure assembly as herein before described and as illustrated with reference to the accompanying drawings.

Dated this the 25<sup>th</sup> day of July, 2001.

## SELFCONTAINED AIR CONDITIONED ENCLOSURE

**Abstract:** A Selfcontained Air Conditioned Enclosure; comprises of an Enclosure (1), connected through plurality of openings (13,14) to air ducts (20,21) of an Air Conditioning Unit (17). The Endosure has a Roof (5), and sidewalls assembled with plurality of Wall Sheets (8) interspaced with Spacer Strips (9) to enhance thermal resistance of the sidewalls. The bottom of the sidewall is inserted under the structure that forms the floor to create an isolated enclosure. The Air Conditioning Unit (17) supplies the Enclosure through the Supply Air Duct (21) and withdraws air through Exit Air Duct (20). Part of the withdrawn air is reconditioned and supplied to the enclosure; the other part is replaced by fresh air. Energy is conserved from the replaced air in Heat Transfer Duct (37) and transferred to fresh air in Fresh Air Chamber (36). Unit efficiency is improved by mixing the exhausted withdrawn air in the Compressor Chamber (31) and exhausted by the Exhaust Air Duct (28). Flow of fresh air is controlled through the Air Damper (39) and Control Knob (38).
